DETAILED ACTION

Claim Rejections - 35 USC § 102

The following is a quotation of the appropriate paragraphs of 35 U.S.C. 102 that form the basis for the rejections under this section made in this Office action:

A person shall be entitled to a patent unless -

(b) the invention was patented or described in a printed publication in this or a foreign country or in public use or on sale in this country, more than one year prior to the date of application for patent in the United States.

Claims 7-10 are rejected under 35 U.S.C. 102(b) as being anticipated by JP 2000-275905. This rejection uses the partial English translation supplied by applicants.

The JP document discloses a toner having a cycloolefin binder resin copolymers (¶¶ [0007] – [0019]), a charge control agent, and a coloring agent (document claim 1). Specific charge control agents include tradename sulfonic acid group charge control agent FCA-1001-NS (¶ [0040]) and a tradename quaternary ammonium salt FCA-201-PS (¶ [0024]). These charge control agents are the same as used in the instant specification for the purposes of a low molecular weight charge control agent having the requisite number-average molecular weight (see application Examples 1 and 4).

Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Application/Control Number: 10/510,978

Art Unit: 1756

Claims 11 and 12 are rejected under 35 U.S.C. 103(a) as being unpatentable over JP 2000-275905 in view of Anno *et al.* in US Patent Application Publication 2002/0042011.

The JP document was discussed above. This reference discloses various cyclic olefin copolymers as the binder resin for the toner binder resin, but does not disclose the specific amount of copolymer with a molecular weight at 7500 or more or the presence of two molecular weight peaks.

The supporting Anno reference teaches that a combination of a resin (A), which is preferably a cyclic olefin copolymer, and a resin (B) dispersed in resin (A) are desirable because they have are effective in full color applications, have excellent electrification properties, good fixability, and image quality (¶¶ [0008], [0011]). A preferred binder resin (A) is TOPAS-COC (¶ [0040]), which is effective in oil-less fixing applications.

It would have been obvious to one having ordinary skill in the art at the time the invention was made to use the toner binder resin combination (A) and (B) of Anno as the binder resin in the JP document because (A) contains a cyclic olefin and the supporting Anno reference teaches that a cyclic olefin polymer in combination with another resin dispersed in the cyclic olefin improves features, such as electrification, fixability, and image quality. Based on the expectation of improved properties the artisan would have ample motivation to use this resin, such as the tradename resin identified above, in the invention of the JP document.

Conclusion

The prior art made of record and not relied upon is considered pertinent to applicant's disclosure.
